Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (BERI/TAR) nucleation depended assembly system of strains of Salmonella, Bscherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene back into the chromosome of the homologous species, replacing the native

copy of that gene; and (4) eliciting an immune response in an animal, compyrising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens(cell), the hybrid fimbrin protein ser usually strong immunogens, which may be important for directing an immune response immunogens, which may be important for directing an immune response in expensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                       o;

Also described are: (1) use of thin aggregative fimbriae (SERIT/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CspA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination accomprising a restrict and amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or

Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful folliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/Cell), the hybrid finbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response inspected epitope, and hybrid fimbriae are easy and inspensive to purify in large amount. The present sequence is given in the exemplification of the present invention

used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The mucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEP17/TAF) nucleation depended assembly system of strains of Salmonella, isoheritchia coil and Enterobacteriacese for the production of fimbriae comprising recombinant AgfA, csgA and AgfA-homologue fimbrin subunits, respectively; (2)

directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the direconsome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein contraining a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid finbrin protein possesses both the immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                2;

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbries (SEPI/TAE) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant of AffA, CSGA and AffA, homologue fimbrin subunits, respectively, (2) directing recombination of a recombinant gene into the chromosome of the homologous species, (3) directing recombinant gene into the chromosome of the homologous species, (3) directing recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene, and (4) eliciting an immune response in an animal. Comprising separating an amino acid polymer comprising a replacement segment cor segments of foreign amino acid sequence or sequences grown on a Salmonella, E coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/Cell), the hybrid finbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live immunogenicity and adhesion properties relevant for an efficient live
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEPI)/TAP) mucleation depended assembly system of strains of Salmonella, Escherichia coli and Enteropacteriacae for the production of fimbriae comprising recombinant of Enteropacteriacae for the production of fimbriae comprising recombinant of AgfA, CsgA and AgfA-homologue fimbrian subunits, respectively; (2) directing recombinant gene into the chromosome of the homologue species, fill directing recombinant gene comprising separating a namino acid polymer comprising recombinant pactor of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement sequent or sequents of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the antimal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant for an efficient live system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein see usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in considering the present invention present sequence is given in
                                                                                                                                                                                                                                                                                                                                 Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MKLLKVAAFAAIVVSGSALAGVYDQLVTRVVTHEMAHASGFDSTLSIYQYGSANAALALQ 60

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (1) use'of thin aggregative finbries (SEFI/TAF) nucleation depended assembly system of strains of Salmonella. Escherichia coli and comprising recombinant of Enteropasceristicaes for the production of fimbries conjusting recombinant of a recombinant gene into the chromosome of the homologous species, (3) directing recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino contention a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or constanting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000.copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immunogens, which may be important for directing an immunogens of the service of imminogens, which may be important for directing an immunogens of the carrier in the hybrid fimbrine seasy and in the carrier of contines and proteins are usually strong immunogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 LVTRVVTHEMAHAGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:

(1) use of thin aggregative finbriae (SEPIT/TAR) nucleation depended assembly system of strains of Salmonella Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant homologue finbrin subunits, respectively; (2) directing recombination of a recombinant gene book into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and inroducing the colymer into the animal in conjunction with a carrier or dillent. (1) is useful for the animal in conjunction with a carrier or dillent. (1) is useful for the book cell, and animal. In a finbrical presentation of a representation of recombinant AghA protein which is useful for the book cells and animal. In a finbrical presentation of a representation of recombinant which is useful for the animal protein an animal. In a finbrical presentation of the contraction with a minmal or the contraction of recombinant which is useful for the contraction of recombinant and in a finbrical presentation of the contraction which is useful for the contraction and animal in a manner center or dillent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and
                                                                                                                                                                                                                               Salmonella, agfA, chromosomal gene replacement, fimbrin, epitope, vaccine, immune response, immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 151;

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA cequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbride (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, respectively; (2) directing recombinating an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA comprising separating an amino acid polymer comprising a recombinant AgfA comprising separating an amino acid polymer comprising a recombinant AgfA comprising separating are presented and in or all meaning are protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the comprising an immune response in an animal. In a fimbrial presentation containing an immune response in an animal. In a fimbrial presentation containing the containing are usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit protein possesses both the immunogens, which may be important for directing an immune response in an immune response capainst the inserted epitope, and hybrid fimbriae are essually strong incompanist the inserted epitope, and hybrid fimbriae are essually strong capainst the inserted epitope, and hybrid fimbriae are essually strong inexpensive to purify in large amount. The presented research and when the companies and the companies and the presented and thybrid fimbriae are essually and adhesion properties research are

                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign periope or antigen. Also described are: (I) use of thin aggregative fimbriae (SERI/TAP) nucleation depended assembly system of strains of Salmonella. Escherichia coli and hererobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene has into the chromosome of the homologues species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species; replacing the native copy of that gene; and (4) eliciting an immune response in an animal, protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or
                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

Also described are:
                                                                                                                                                                                                                                                                                                                      ij
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) useful for the expression of recombinant AgfA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier finbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SDARKSETTITQSGYGNGADYDQLVTRVVTHEMAHAFRNNATIDQWNAKNSDITVGQYGG

assembly system of strains of Salmonella Escherichia coli and assembly system of strains of Salmonella Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant Gaffa, CsgA and Agfa-homologue finbrin subunits, respectively (2) directing recombination of a recombination of a recombinant gene homologues species, is a recombinant gene homologue species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant Agfa protein which is useful for the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid finbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit for the carrier fimbrial subunit for the carrier fimbrial subunit for the immunogenic fimbria are easy and immune response and hybrid fimbriae are easy and incompleted and hybrid fimbriae are easy and incompleted and hybrid fimbriae are easy and and the copies of the copies and hybrid fimbriae are easy and the copies of the copies and hybrid fimbriae are easy and the copies of the copies and hybrid fimbriae are easy and the copies of the copies and hybrid fimbriae are easy and the copies and the copies of the copies and hybrid fimbriae are easy and the copies and the copies and hybrid fimbriae are easy and the copies and the copies and hybrid fimbriae are easy and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copies and the copi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SDARKSETTITQSGYGNGADV9GGADNYDQLVTRVVTHENAHADQWNAKNSDITVGQYGG 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: sequence which encodes a foreign epitope or antigen. Also described are: or sequence which are (SEPI)/TAPA nucleation depended assembly system of strains of Salmonella. Escherichia coli and Enterobacteriaceae for the production of finbriae comprising recombinant coli and investing recombination of a recombinant on the chromosome of the homologous species, replacing the native copy of that gene, and (4) eliciting an immune response in an animal. Copy of that gene, and (4) eliciting an immune response in an animal copy is separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, B. coll or comprising separating in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgiA protein which is useful for the expression or recombinant AgiA protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid finbrin protein possesses both the contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an efficient live contains and an antimal and efficient live contains and an animal and efficient live contains and an efficient live.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0

The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MKLLKVAAFAAIVVSGSALAGVYDQLVTRVVTHEMAHASGPDSTLSIYQYGSANAALALQ
                                     Recombinant agfA gene having a segment replaced by a foreign DNA seq
which encodes foreign epitope or antigen, expresses recombinant AgfA
protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Example 2; Fig 7; 85pp; English.

```
The sequence represents the Salmonella enteritis 27655-3b TnphoA mutant strain Agfa protein. The encoding DNA and isolated Agfa protein are used in genetic immunization and vaccine compositions, respectively, to elicit an immune response to Salmonella in animals (e.g. food producing animals) and humans. (Updated on 25-MAR-2003 to correct DN field.) (Updated on 27-AUG-2003 to correct OS field.)

                             The present sequence represents an agfA fragment encoded by an agfA gene fragment derived from Salmonella enteritidis 27655-3b TnphoA mutant strain. The mucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 7, Application US/09142648B

Patent No. 6210948

CENERAL INFORMATION:

CENERAL INFORMATION:

APPLICANT: Smit. John

APPLICANT: Smit. John

APPLICANT: Bingle, Wade H.

APPLICANT: No. 6210948ellini, John F.

TITLE OF INVENTION: EXPRESSION AND SECRETION OF HETEROLOGOUS POLYPEPTIDES FROM CAULC FILE REFERENCE: 08106/00202

CURRENT FILING DATE: 1999-03-30

PRIOR APPLICATION NUMBER: US/09/142,648B

PRIOR APPLICATION NUMBER: US/09/142,648B

PRIOR APPLICATION NUMBER: US/09/142,648B

PRIOR APPLICATION NUMBER: US/09/142,648B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           48;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 6 Application US/09336115C

Patent No. 65 Application US/09336115C

Patent No. 66 Application Sequence 6 Application Sequence 7

APPLICANT: Weltzin, Richard A.

APPLICANT: Guy, Bruno

TITLE OF INVENTION: LT and CT in Parenteral Immunization

TITLE OF INVENTION: Modera Against Helicobacter Infection

FILE REFERENCE: 06132/055002

CURRENT APPLICATION NUMBER: US/09/336,115C

CURRENT FILING DATE: 1999-06-18

PRIOR APPLICATION WHERE: US 09/100,258
                                   APPLICANT: Guy, Eruno
ITILE OF INVENTION: Hand CT in Parenteral Immunization
ITILE OF INVENTION: Hand CT in Parenteral Immunization
ITILE OF INVENTION: Hold Spainst Helicobacter Infection
FILE REPERENCE: 06132/055002
CURRENT APPLICATION NUMBER: US/09/336,115C

US-08-038-682-2

Sequence 2, Application US/08038682

PRETENT NO. 5549804

GENERAL INFORMATION:

APPLICANT: ST. GEME III. JOSEPH W

TITLE OF INVENTION: HIGH MOLECULAR WEIGHT SURFACE PROTEINS

TITLE OF INVENTION: OF NON-TYPEABLE HAEMOPHILUS

NUMBER OF SEQUENCES: 8

CORRESPONDENCES: 8

CORRESPONDENCE ADDRESS:

ADDRESSE: Shoemaker and Mattare, Ltd

STREET: 200 Jefferson Davis Hwy., 1203 Crystal Plaza

STREET: Wighina

COUNTRY: U.S.A.

ZIP: 22202-0286

COMPUTY: U.S.A.

Patent No. 5603938

GENERAL INFORMATION:

APPLICANT: Barenhamp, Stephen J

TITLE OF INVENTION: High Molecular Weight Surface Proteins

TITLE OF INVENTION: of No. 5603938-Typeable Haemophilus

NUMBER OF SEQUENCES: 8

CORRESPONDENCE ADDRESS:

ADDRESSEE: Shoemaker and Mattare, Ltd.

STREET: 2001 Jefferson Davis Hwy., 1203 Crystal Plaza

STREET: Bidg. 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CURRENT APPLICATION DATA:

Patent No. US20020172684A1

GENERAL INFORMATION:
APPLICANT: Nano, Francis
TITLE OF INVENTION: Mycobacterium Tuberculosis DNA Sequences Encoding
TITLE OF INVENTION: immunostimulatory Peptides
TITLE OF INVENTION: immunostimulatory Peptides
TILE REFERENCE: 61260
CURRENT APPLICATION NUMBER: US/09/996,634
CURRENT FILING DATE: 2001-11-28

PRIOR PLING DATE: 2000-01-03
PRIOR PLING DATE: 1997-12-15

PRIOR PLING DATE: 1996-06-14

PRIOR PLING DATE: 1996-06-14

PRIOR PLING DATE: 1996-06-14

PRIOR PLING DATE: 1996-06-14

PRIOR PLING DATE: 1996-06-15

NUMBER: OF SEQ ID NOS: 169
